## X-RAY DIFFRACTION

The reported resolution of this entry is $1.80 \AA$.
Percentile scores (ranging between $0-100$ ) for global validation metrics of the entry are shown in the following graphic. The table shows the number of entries on which the scores are based.

| Metric | Whole archive <br> (\#Entries) | Similar resolution <br> (\#Entries, resolution range $(\AA)$ ) |

The table below summarises the geometric issues observed across the polymeric chains and their fit to the electron density. The red, orange, yellow and green segments of the lower bar indicate the fraction of residues that contain outliers for $>=3,2,1$ and 0 types of geometric quality criteria respectively. A grey segment represents the fraction of residues that are not modelled. The numeric value for each fraction is indicated below the corresponding segment, with a dot representing fractions $<=5 \%$

Note EDS was not executed.

| Mol | Chain | Length | Quality of chain |  |  |

## 3 Residue-property plots (i)

These plots are drawn for all protein, RNA, DNA and oligosaccharide chains in the entry. The first graphic for a chain summarises the proportions of the various outlier classes displayed in the second graphic. The second graphic shows the sequence view annotated by issues in geometry. Residues are color-coded according to the number of geometric quality criteria for which they contain at least one outlier: green $=0$, yellow $=1$, orange $=2$ and red $=3$ or more. Stretches of 2 or more consecutive residues without any outlier are shown as a green connector. Residues present in the sample, but not in the model, are shown in grey.

Note EDS was not executed.

## 5 Model quality (i)

### 5.1 Standard geometry (i)

Bond lengths and bond angles in the following residue types are not validated in this section: ADP

The Z score for a bond length (or angle) is the number of standard deviations the observed value is removed from the expected value. A bond length (or angle) with $|Z|>5$ is considered an outlier worth inspection. RMSZ is the root-mean-square of all Z scores of the bond lengths (or angles).

| Mol | Chain | Bond lengths |  | Bond angles |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | RMSZ | $\#\|Z\|>5$ | RMSZ | $\#\|Z\|>5$ |
| 1 | A | 0.41 | $0 / 2223$ | 0.59 | $0 / 3013$ |
| 1 | B | 0.44 | $0 / 2215$ | 0.60 | $0 / 3001$ |
| 1 | C | 0.39 | $0 / 2207$ | 0.59 | $0 / 2990$ |
| All | All | 0.42 | $0 / 6645$ | 0.59 | $0 / 9004$ |

Chiral center outliers are detected by calculating the chiral volume of a chiral center and verifying if the center is modelled as a planar moiety or with the opposite hand.A planarity outlier is detected by checking planarity of atoms in a peptide group, atoms in a mainchain group or atoms of a sidechain that are expected to be planar.

| Mol | Chain | \#Chirality outliers | \#Planarity outliers |
| :---: | :---: | :---: | :---: |
| 1 | A | 0 | 1 |
| 1 | B | 0 | 1 |
| All | All | 0 | 2 |

There are no bond length outliers.
There are no bond angle outliers.
There are no chirality outliers.
All (2) planarity outliers are listed below:

| Mol | Chain | Res | Type | Group |
| :---: | :---: | :---: | :---: | :---: |
| 1 | A | 241 | LYS | Peptide |
| 1 | B | 241 | LYS | Peptide |

### 5.2 Too-close contacts (i)

In the following table, the Non-H and H (model) columns list the number of non-hydrogen atoms and hydrogen atoms in the chain respectively. The H (added) column lists the number of hydrogen atoms added and optimized by MolProbity. The Clashes column lists the number of clashes within
the asymmetric unit, whereas Symm-Clashes lists symmetry-related clashes.

| Mol | Chain | Non-H | H(model) | H(added) | Clashes | Symm-Clashes |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | A | 2184 | 0 | 2156 | 12 | 0 |

| 3 | A | 312 | 0 | 0 | 4 | 0 |
| 3 | B | 288 | 0 | 0 | 6 | 0 |
| 3 | C | 295 | 0 | 0 | 2 | 0 |
| All | All | 7508 | 0 | 6489 | 86 | 0 |

The all-atom clashscore is defined as the number of clashes found per 1000 atoms (including hydrogen atoms). The all-atom clashscore for this structure is 7 .

All (86) close contacts within the same asymmetric unit are listed below, sorted by their clash magnitude.

In the following table, the Counts columns list the number of bonds (or angles) for which Mogul statistics could be retrieved, the number of bonds (or angles) that are observed in the model and the number of bonds (or angles) that are defined in the Chemical Component Dictionary. The Link column lists molecule types, if any, to which the group is linked. The Z score for a bond length (or angle) is the number of standard deviations the observed value is removed from the expected value. A bond length (or angle) with $|Z|>2$ is considered an outlier worth inspection. RMSZ is the root-mean-square of all Z scores of the bond lengths (or angles).

The following is a two-dimensional graphical depiction of Mogul quality analysis of bond lengths, bond angles, torsion angles, and ring geometry for all instances of the Ligand of Interest. In addition, ligands with molecular weight $>250$ and outliers as shown on the validation Tables will also be included. For torsion angles, if less then $5 \%$ of the Mogul distribution of torsion angles is within 10 degrees of the torsion angle in question, then that torsion angle is considered an outlier. Any bond that is central to one or more torsion angles identified as an outlier by Mogul will be highlighted in the graph. For rings, the root-mean-square deviation (RMSD) between the ring in question and similar rings identified by Mogul is calculated over all ring torsion angles. If the average RMSD is greater than 60 degrees and the minimal RMSD between the ring in question and any Mogul-identified rings is also greater than 60 degrees, then that ring is considered an outlier. The outliers are highlighted in purple. The color gray indicates Mogul did not find sufficient equivalents in the CSD to analyse the geometry.
